

GEAFOL Cast-Resin Transformers 100 to 16000 kVA

Cast-Resin Transformers

Catalog TV1 · 2007

Power Transmission and Distribution

SIEMENS

Application

Safe technology

Wherever distribution transformers have to assure the utmost safety in areas frequented by people, GEA FOL cast-resin transformers are the ideal solution. With GEA FOL, the limitations of liquid-filled transformers are avoided, but the proven characteristics such as operational reliability and service life are retained.

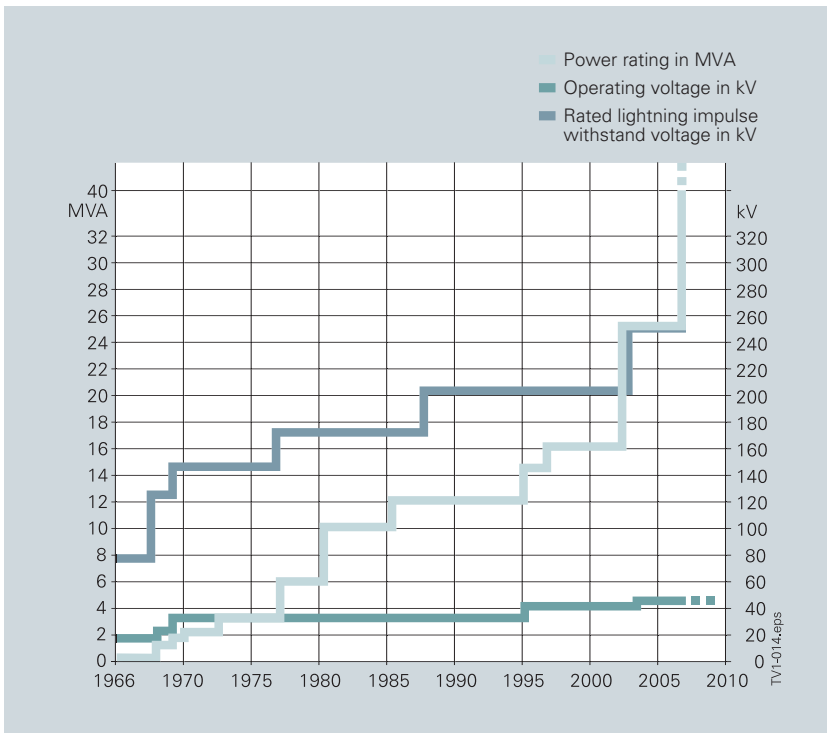

Not for nothing are GEA FOL cast-resin transformers used, above all, wherever there can be no compromises with regard to safety. They are to be found in high-rise buildings, hospitals, road and underground railway shafts, in offshore installations and mines and many other locations.

It is not surprising that the superior GEA FOL technology is produced under licence by many transformer manufacturers all over the world. Over 85,000 GEA FOL cast-resin transformers have proved their worth in power distribution all round the globe.

The diagram below shows the power rating and voltage range developments achieved since 1966 as a result of continuous innovation.

Nowadays, GEA FOL cast-resin transformers up to a power rating of approximately 40 MVA are being manufactured.

Development of voltage and power ratings:

Supersedes: Catalog TV 1 · 2004

The products and systems described in this catalog are manufactured and sold according to a certified quality and environmental management system (acc. to ISO 9001:2000 and ISO 14001:2004). (DQS Certificate Reg. No. DQS 001052 QM UM). The certificate is accepted in all IQNet countries.

© Siemens AG 2007

Design, Features

① Three-limb core

Made of grain-oriented, low-loss electrolaminations insulated on both sides

② LV winding

Made of aluminium strip. Turns firmly glued together by means of insulating sheet wrapper material

③ HV winding

Consisting of vacuum-potted single foil-type aluminium coils

④ LV connection

Normal arrangement: Top, rear
Special version: Bottom, available on request at extra charge

⑤ HV connection

Variable arrangement, for optimal station design

HV tapings on high-voltage connection side

For adjustment to system conditions, reconnectable in deenergized state

⑥ Coil support system

To insulate core and windings from mechanical vibrations, resulting in low noise emissions

⑦ Clamping frame and truck

Rollers can be turned around for lengthwise or sidewise travel

⑧ Insulation: Mixture of epoxy resin and quartz powder

Makes the transformer practically maintenance-free, moisture-proof, tropicalized, flame-resistant and self-extinguishing, without using aluminium oxide trihydrate

⑨ Connection tubes

Temperature monitoring

By PTC thermistor sensors in the LV winding (on request PT 100)

Paint finish on steel parts

Thick-layer coating, RAL 5009

On request:

Two-component varnish or galvanizing (for particularly aggressive environments)

Modular design

E.g. windings can be individually mounted and replaced on site

Ambient class E2

Climatic category C2

(if the transformer is installed outdoors, degree of protection IP23 must be assured)

Fire class F1

630 kVA GEAFOLE
cast-resin transformer,
 $U_f = 20$ kV

Selection and Ordering Data

Distribution transformers according to HD 538, 50 Hz, Dyn 5 or Dyn 11, IP00 without housing (housings IP.., see page 12).

All GEA FOL cast-resin transformers according to IEC 60076-11, rated power > 2500 kVA are not standardized.

Other versions and special equipment on request.

1) Ratings in brackets are not standardized.

2) Dimension drawing: page 14.

Selection and Ordering Data

Distribution transformers according to HD 538, 50 Hz, Dyn 5 or Dyn 11, IP00 without housing (housings IP..., see page 12).

All GEAFOL cast-resin transformers according to IEC 60076-11, rated power > 2500 kVA are not standardized.

Other versions and special equipment on request.

Connection System

Practice-oriented options for connection of the high-voltage and the low-voltage side are a distinguishing feature of the flexible connection philosophy of GEA FOL transformers.

Connection of the high-voltage side

In the standard design, the HV connection of the transformer is at the top coil connection, connection at the bottom is available as an option (Fig. 1). Screwed connection tubes are used for the delta connection. The transformer connection is made at the end of the connection tubes.

Connection of the high-voltage side using plug-type connectors

Connection of the HV side by using outside cone plug-type bushings is possible (see Fig. 2)

High-voltage tapplings

The HV tapplings allow matching to local network conditions. In deenergized state, the desired tapping can be selected by means of connection straps and screwed connections.

Connection of the low-voltage side

In the standard design, the LV connection of the transformer is also at the top; connection at the bottom is available as an option (Fig. 3).

If intermediate expansion links are employed, the LV side connection is protected against mechanical stress and transmission of structure-borne noise is drastically reduced.

Connection of earthing and short-circuiting devices

Either straight or angled spherical/earthing points, of diameter 20 mm or 25 mm, can be mounted at the connection tubes of the HV side and at the LV side at the conductor terminal face.

Fig. 1 Variable connection possibilities, e.g. at the delta-connected HV side

Temperature Supervision, Forced-Air Cooling

Temperature supervision

Either PTC thermistor sensors, PT 100 resistance temperature detectors or a capillary tube thermometer can be employed for temperature supervision of GEAFOL transformers. The temperature of the LV windings is monitored and in addition in the case of converter transformers, also the core temperature is monitored. The most economical solution is monitoring by means of PTC thermistor sensors and tripping device without indication of the temperature. All GEAFOL transformers are provided with at least one PTC thermistor sensor circuit for tripping purposes.

Function

Temperature supervision by means of PTC thermistor sensors: In the case of three-phase transformers a system consists of 3 PTC thermistor sensors, connected in series, according to DIN – one sensor per phase – and a tripping device.

The PTC thermistor sensors function as resistances: When the response temperature of a sensor is reached, a step-change in resistance occurs and the contact in the tripping device is operated.

As soon as the temperature of the winding falls below the response temperature by approx. 6 K, the contact returns to its original position.

Typical circuit diagram for temperature supervision

Power supply for the tripping device from a system fed from the transformer to be protected

The supervision system is fail-safe. It thus provides protection against a wire-break in the sensor circuit.

When two sensor systems are employed for temperature supervision, one is connected to provide alarm signalling and the other tripping. The rated response temperatures of both systems differ by 20 K. A third system can, for example, be used for fan control.

If the control supply voltage for temperature supervision is taken directly from the secondary side of the transformer, a time relay is sometimes needed, depending on the unit. This time relay is used to bridge the time interval between energizing the transformer and pick-up of the relay in the tripping device.

The ambient temperature for the tripping device is limited to 55 °C. For this reason installation of the tripping device in medium or low-voltage distribution cabinets is to be recommended.

Additional forced-air cooling to increase the transformer output

GEAFOL transformers can be equipped with radial-flow fans to increase their output rating by up to 50 %. If the output is increased by e.g. 40 %, the load losses stated in the list will be doubled and the impedance voltage will be linearly increased by 40 %.

The fans are automatically switched on or off via thermistor sensors in the LV winding.

GEAFOL transformer with attached radial-flow fans

Special Housings, Notes

Dimensions

- 1 High-voltage terminals
- 2 High-voltage tappings on HV side
- 3 Low-voltage terminals

Dimensions a, b and h, see pages 5 to 9

In addition to the standard housings, we also supply housings with framework construction and doors, which can also be fitted with roof fans. These housing types can be installed in combination with low and medium-voltage cabinets.

Please contact us for more information.

Notes:

The technical data, dimensions and weights are subject to change unless otherwise stated on the individual pages of this catalog.

The illustrations are for reference only.

All product designations used are trademarks or product names of Siemens AG or of other suppliers.

All dimensions in this catalog are given in mm.

The information in this document contains general descriptions of the technical options available, which do not always have to be present in individual cases. The required features should therefore be specified in each individual case at the time of closing the contract.
